Contents

Chapter 1

Prerequisites

This is a set of *course notes* for SOCIOLOGY 3412: Social Networking. All examples are written in the R Statistical programming language. It is recommended that you use R-Studio as your IDE for this course as it is the one that will be demonstrated in lecture.

1.1 R

R is a statistical programming language that is popular in industry and academia. It is open source and has very powerful tools for analysis and visualization. I recommend running yourself through an online tutorial before the course begins. A popular one is run by *DataCamp* and is free and can be found here. However, there are a number of alternatives, all of which can be found on google.

1.2 STATNET and igraph

We will be using the following packages from the STATNET project:

```
install.packages('network')
install.packages('ergm')
install.packages('sna')
install.packages('EpiModel')
```

We will also on occasion make use of the **igraph** package:

```
install.packages('igraph')
```

1.3 networkdata and devtools

We will occasionally use packages created by the author and installed via github. To do this you will first need to install **devtools**:

```
install.packages("devtools")
```

Then you can install the **networkdata** package and other packages created for this course as needed, e.g.,

```
library(devtools)
install_github("zalmquist/networkdata")
```

Chapter 2

Networks and Network Thinking

2.1 Overview

Network science and social network analysis provide both a theoretical and methodological foundation for understanding our social world. ? explains the social network field as follows:

The social network field is an interdisciplinary research program which seeks to predict the structure of relation- ships among social entities, as well as the impact of said structure on other social phenomena. The substantive elements of this program are built around a shared chore of concepts and methods for the measurement, representation, and analysis of social structure. These techniques (jointly referred to as the methods of social network analysis) are applicable to a wide range of substantive domains, ranging from the analysis of concepts within mental models (?,?) to the study of war between nations (?).

2.2 Introduction to Network Concepts

To begin our journey into the nature of social networks, we first must define what a **relationship** entails.
